About Me

I am currently pursuing a combined MS/PhD in the Security Optimization Research (SOR) Lab at Seoul National University. The research topics I have been following are focused on hardware/system/AI security – actually, I would rather say *privacy*. I have been active in topics related with privacy enhancing techniques (PETs), especially on how to integrate them with applications such as Machine Learning as a Service.

I deem that privacy is a crucial factor in the following era, and is eager to contribute in related fields. My research goal is to *design efficient privacy-enhancing computing systems*. To achieve this goal, I am currently pursuing research on various PETs (Homomorphic Encryption, Multi-Party Computation, Trusted Execution Environments etc). Specifically, my research topics lie in applying non-numerical approaches (HW acceleration, compiler, algorithm related techniques) to optimize the performance and minimize the downsides of PETs.
